

Chordates

Study Notes & Vocabulary Review

Name: _____

- The order of the classes is from “Least evolved -> Most evolved”
- These study notes contain **most** of the information in the Chordate PowerPoint Notes.
- Characteristics that apply to more than one class, have the words used more than once.
- Next to each class in the “hand printing font”, I have put the **Must Know Items**. Quiz each other on them (or put them on flashcards).

General Characteristics of Phylum Chordata

_____—surface of the body where the ***hollow nerve cord*** is located

_____—a supporting rod running below the nerve cord at some point in the life span of chordates

_____—pouches, found near the throat region, are present in all chordates, also known as “gill pouches or gill slits”, they only appear in early development in some chordate classes

_____—extends beyond the anus for at least part of their lives

Sub-Phyla of Chordata

- Non-vertebrate Chordates: lack a bony backbone of vertebrae surrounding the nerve cord

_____—invertebrate chordates which look a bit like a fish, but do not have fins

_____—filter-feeding, invertebrate chordates

- vertebrata: have a bone / vertebrae surrounding the nerve cord (like our backbone)

_____—individual segments which together make up a backbone

Class Agnatha: - these fishes are jawless

- _____ —the class which includes the **jawless** fishes
- _____ —the jawless fish which produces copious amounts of slime
- _____ —the parasitic jawless fish which sucks the body fluids out of its host
- _____ —structures covering the outer surface of fish
- _____ —structures used by fish for respiration
- _____ —the number of chambers in the heart of a fish

Class Chondrichthyes: these fishes have jaws and cartilage

- _____ —class which includes the **sharks, skates, and rays**
- _____ —major advancement in their ability to feed
- _____ —makes up the skeleton of sharks and rays
- _____ —structures covering the outer surface of fish
- _____ —structures used by fish for respiration
- _____ —the number of chambers in the heart of a fish

Class Osteichthyes - these fish have jaws and bones

- _____ —the class which includes fish like perch, salmon, and tuna
- _____ **-finned** —fish which have thin fins
- _____ **-finned** - terrestrial organisms are believed fish ancestor
- _____ —structures covering the outer surface of fish
- _____ —structures used by fish for respiration
- _____ —the number of chambers in the heart of a fish
- _____ —fishes whose eggs hatch outside the mothers body Latin words ovi = egg
- _____ —fishes whose eggs develop and hatch within the mother's body leading to "live" birth
Latin words: ovi = egg; vivi = live
- _____ —fishes whose young develop inside the mother without the presence of an egg
Latin words: vivi = live

Class Amphibia - this class is making the "jump" onto land
-they must lay their eggs in water

shutterstock · 35459578

- _____ —the class of organisms that are aquatic as larvae and terrestrial as adults
- _____ —an additional respiratory organ in amphibians - it must be kept moist to do its job
- _____ —a membrane which serves as a transparent eyelid in frogs
- _____ —a membrane involved a frog's sense of hearing **SKIN**—an additional respiratory organ in amphibians - it must be kept moist to do its job
- _____ —large, piercing teeth found on the roof of the frog's mouth
- _____ —structures present in adult amphibians for respiration
- _____ —a structure, found in many organisms, through which digestive wastes, urine, and gametes leave the body
- _____ —the number of chambers in the amphibian heart

Class Reptilia:

Well adapted for living on land, and dry environments. Adaptations include:

- Well-developed lungs and "3 1/2" chambered heart
- Strong limbs
- Water-conserving excretory system
- Internal fertilization and amniotic egg

shutterstock · 284881604

- _____ —class of vertebrates which have dry, scaly skin, lungs, and terrestrial eggs
- _____ — egg which can develop in a terrestrial environment without drying out
- _____ —the number of chambers a reptilian heart, (some types of reptiles show evolution toward a 3.5 chambered heart)

Body Temperature: the dividing line

All of the Classes ABOVE are "cold-blooded".

- _____ —organisms whose body temperature depends on the surrounding environment

The Classes below are "warm-blooded".

- _____ —organisms whose body temperature is regulated internally
-

Class Aves: Adaptations for flight include:

shutterstock 18711184

- Two legs covered in scales for walking or perching;
- Two limbs (wings) covered in feathers, -most species can fly
- One way flow of air through the respiratory system via air sacs and then the lungs - allows higher metabolic rate
- Internal fertilization and amniotic egg with shell

_____ the class of vertebrates which includes birds
 _____—structures which aid in flight and provide insulation in birds
 _____—the number of chambers in a bird's heart

Class Mammalia: Feed young from mammary glands, and bodies covered with hair.

(C) 18 ORIC

Groups:

• Monotremes—lay eggs

• Marsupials—most development occurs in pouches

• Placental Mammals— development occurs inside the mother

_____—glands which produce milk
 _____—this substance covers the outer surface of most mammals
 _____—substance found beneath the skin in mammals which conserves body heat and provides a storage form of energy
 _____—the number of chambers in a mammals heart
